FC domain, pharmacologically active peptides, and linkers. Where (I) is: (Al)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L2)d-P2, (L3)e-P3, or -(L1)c-P1, -(L2)d-P2, (L3)e-P3, where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently laws cytostatic, antiasthmatic, thrombolytic and immunosuppressive be used for producing pharmaceutical compositions. The composition can activities DNAs vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are market.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for treating cancer, astima, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                               The present invention describes composition of matter (I) comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autolmmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; minetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1;
                                  Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P2-(L3)e-P3-(L4)e-P1-(L2)d-P3-(L4)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)
                                                                                                                                                                                                                                                                                                                                                                                                                        useful for treating cancer, astura, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2-X_1_1, X_2-X_1_1, X_2-X_1_2, X_2-X_1_1, X_2-X_1_1, X_2-X_1_2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-X_1-2, X_1-2-2, X_1-X_1-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2, X_1-2-2,

A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2 - X_{-1} = 0, X_2 - X_{-1} = 1, X_2 - X_{-1} = 1, X_1 - X_1 - X_1 = 1, X_1 - X_1 - X_1 - X_1 = 1, X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1 - X_1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                           production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Q
```

```
re domain, pharmacologically active peptides, and inhers. Where (I) is:

(X1)a *FI-(X2)b, where: FI = an Fc domain; X1 and X2 = are each
independently selected from *(L1)c-P1-(L2)d-P2-(L3)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P3, or *(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
where P1, P2, P3, and P4 = are each independently sequences of
pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
of or 1, provided that at least 1 of a and b is 1. The composition can
have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
activities. DNAs, vectors and host cells from the present invention can
be used for producing pharmaceutical compositions. The compositions are
useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
The use of an Fc domain (rather than a Fab domain) can provide a longer
half-life or incorporate functions such as Fc receptor binding, protein
chalf-life or incorporate functions such as Fc receptor binding, protein
chalf-life or AAA69526 and AAB16955 cand phase of the present invention.

Sequences used in the exemplification of the present invention.
                                                                                                                                                               The present invention describes composition of matter (I) comprising an

useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AA69443 to AAA69256 and AAB16955 to AAAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                     The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)e-P2, -(L3)e-P2, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently sequences of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes composition of matter (1) comprising an Producin pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain, X2 = are each independently selected from -(L1)c-F1-(L1)c-F1-(L2)d-F2, where P1, P2, P3, and P4 = are each independently sequences of where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently of or L, provided that at least 1 of a and b 1s. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein to AAA69526 and AAB18055 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)3-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(I)-C-F1-(I2)d-F2.

(L1)C-P1-(L2)d-F2-(L3)e-F^3, or -(L1)C-P1-(L2)d-F2-(L3)e-F3-(L4)f-F4 where F1, P2. P3, and P4 = are each independently sequences of paramacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer asthma, thrombosis, or autoimmune diseases.

CC activities of an FC domain (rather than a Fab domain) can provide a longer complement fixation, and possibly placental transfer. AAA69443

CC AAA69256 and AAB16956 to AAB1803 represent uncleotide and amino acid cycles are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-F1-(L1)c-F2.

-(L1)c-F1-(L2)d-F2-(L3)e-F^3, or -(L1)c-F1-(L2)d-F2-(L3)e-F3-(L4)f-F4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be performed pharmaceutical compositions. The compositions are useful for treating pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer as the incorporate functions such as Fc receptor binding, protein a shift of a second or incorporate functions with a fab domain can be absorbed to the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunoglobulin, IgG1, Fc; thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anaemic; dermatological; immunosuppressive; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A compound which binds to an mpl receptor comprising a thrombopoletin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising x_2-x_1_0, x_2-x_1_1, x_2-x_1_2, x_2-x_1_1, x_1-x_1-x_1, x_1-x_1-x_1, x_1-x_1-x_1, and

The compounds bind to and activate the c-Mpl receptor which mediates the activity of endogenous thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. applastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.

pharmacologically active peptides; II, L2, I3, and L4 = are each independently linkers; and a. b, c. d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69526 and AAB18093 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently
                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP: inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

ô
O or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18055 to AAAB18003 represent nucleotide and maino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_L^{-1}(L_L^{-1})_L TMP_L^{-2}], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least
                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'note= "optionally modified by bromoacetyl or PEG"

```
pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein a binding, complement fixation, and possibly placental transfer. AaA69443 to AAA69526 and AAB18032 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases -

Example 1; Page 324; 608pp; English.

Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.
(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently present invention describes composition of matter (I) comprising an The

Thrombopoietin, mimetic, TMP, TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
O or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer Thalf-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB180915 to AAAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thrombopoietic peptides which activate mpl receptors and increase the

pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 deast 1 and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNas, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions, or acception are used for producing paramaceutical compositions, or activitions are used of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein a binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18035 to AAAB180303 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (x1)a-F1-(x2)b, where: FI = an FC domain; x1 and x2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; Li, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently
                                                                                                                                                                                                                                                                                                                                                      Gaps

O or 1, provided that at least 1 of a and b is 1. The composition can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases -

Example 1; Page 323; 608pp; English.

Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (XI)a-FI-(X2)b, where: FI = an Fc domain, XI and XI = are each independently selected from -(LI)c-PI, -(LI)c-PI-(LI)d-P2, (LI)d-P2, (LI)d-P2, (LI)d-P2, P3, or -(LI)c-PI, -(LI)c-PI-(LI)d-P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; LI, LI, LI, LI, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently or I, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive The present invention describes composition of matter (I) comprising

```
activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA694343 to AAA69526 and AAB18093 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes composition of matter (I) comprising an (X1)a-F1-(X2)b, where F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.

-(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently have cytostatic, antiasthmatic, thrombollytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are

useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69434 to AAA69526 and AAB18095 to AAAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes composition of matter (I) comprising an (XI)a-FI-(X2)b, where: FI = an Fc domain; XI and XZ = are each independently selected from -(LI)C-FI-(LI)C-FI-(LZ)d-FZ.

(LI)C-FI-(LZ)d-FZ-(LZ)a-FY-3, or -(LI)C-FI-(LZ)d-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(LZ)a-FZ-(

Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases -

Example 1; Page 319; 608pp; English.

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-FL-(X2)b, where: F1 = an FC domain; X1 and X2 = are each
independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2.(L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4

(Inc-P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, e, and f = are each independently linkers; and a, b, c, e, and b is 1. The composition can have exprostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an FC domain (rather than a Fab domain) can provide a longer

ine present inventions describes compositions of marcet (1) compitating and for domain, pharmacologically active peptides, and linkers. Where (1) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2-(L3)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4.

(Mere P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently inkers; and a b, b, c, d, e, and f = are each independently (0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be useful for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein can be an incorporate functions such as Fc receptor binding, protein composition, complement fixation, and possibly placental transfer. AAAA6943 complemences used in the exemplification of the present invention.
                                                                                    Ϊ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present invention describes composition of matter (I) comprising an

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (XI)a-FI-(X2)b, where: FI = an FC domain, XI and X2 = are each independently selected from -(L1)C-PI-(L1)C-PI-(L2)d-P2.

-(L1)C-FI-(L2)d-F2-(L3)e-F3, or -(L1)C-PI-(L2)d-P2-(L3)e-F3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently active part at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be useful for treating pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an FC domain (rather than a Fab domain) can provide a longer
                                                                                     ή.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; famunosoppressive; EPO; TPO; CTLA4; minetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes composition of matter (I) comprising an (X1)a-FI-(X2)b, where FI = an FC domain; X1 and X2 = are each independently selected from -(L1)c-PI-(L2)d-P2.

(L1)c-PI-(L2)d-P2-(L3)e-P^3, or -(L1)c-PI-(L2)d-P2-(L3)e-P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for treating cancer, asthma, thrombosis, or autoimmue diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

AAY96521 standard; peptide; 36 AA.

AAY96521;

04-SEP-2000 (first entry)

Cyclic or linear thrombopoietin mimetic peptide compound 2.

Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.

Synthetic

'note= "optionally linked to an Fc molecule" Location/Qualifiers /label- TMP\_1 Disulfide-bond Modified-site Peptide 

'note= "optional" 15..22 /label= linker Peptide Peptide

23..36 /label= TMP\_2

(AMGE-) AMGEN INC.

Liu C, Feige U, Cheetham J;

WPI; 2000-365108/31.

Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia

Claim 16; Page 61; 91pp; English.

mimetic peptide (TMP) dimer joined by a linker [TMP]-[(L.1)\_nTMP\_2],

s new. TMP\_1 and TMP\_2 are amino acid sequences varying from at least

10 to 14 residues in length comprising X\_2-X\_1\_0, X\_2-X\_1\_1, X\_2-X\_1\_2,

X\_2-X\_1\_3, X\_2-X\_1\_4, X\_1^2, X\_1^

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
